

My vision as an engineer.

With the recent advancements in cloud technology and high-speed internet, I believe that most of the companies will shift to cloud, over in-premise solutions. The shift does not have to stop at big companies only, individual machine learning engineers now can utilize cloud computing to train their models, its much cheaper and efficient over building their own computing setups. Maybe In future we can shift our entire workloads to cloud rather than buying individual personal computers, which not only will be good for environments, but also economic, as economies of scale would play a key role in it,

As devOps/cloud engineer I believe my skills would of great applicability. When thinking of software, we often limit ourselves to just thinking about the code and design principles but deploying and making it available to audience is just as important too. As a devOps engineer we deploy most economic solutions for deployment as well as continuous development and integration of code. My Aim is to help in advancement in cloud technology such that it can be used to greater good and serve more people.
