Hi,

I will start with an elevator pitch.
My name is Karamjit, I am third year computer science student at York university. I am currently interning as devOps engineer at CGI. As a devOps engineer you develop and maintain CI/CD pipelines, set up VMs, environments, monitor server and ensure that services are running. We primarily rely on Atlassian suite which includes JIRA, bitbucket and Jenkins. Another critical aspect of being devOps engineer is to automate the deployment process and remove the need of manual intervention as much as possible.
Before starting my journey in computer science, I was in manufacturing industry, we made automobile parts. I obtained my diploma in mechanical engineering from Sheridan in 2017 and then worked in Mississauga as a CNC programmer for three years at commercial spring and tool.

I was born in Ludhiana, Punjab, India. There is nothing romantic about the city, no beautiful or breathtaking views, just pollution and a lot of traffic. But one thing it did had was my childhood and there are few things I adore about my city, like my high school, my friends, and the street food.

Here is a picture of me with my friends with my school in background.

It captures my childhood perfectly, the chaos in market behind, my high school and friends who I grew up with. I learned a lot from them, and they made me the person who I am today.
